Hello Professor,

My name is Mike Wagner; I am the creator of HyperGrade. This website manages and automates homework for computer science courses. You may either use pre-built questions or you can upload your own code to create custom questions. **Currently, we support C, C++ C#, Java, and Python**. We have been around for over 10 years, and we serve community colleges across the country.

In our platform, grading becomes extremely quick. Students get instant feedback and teachers approve or override recommended grades. Best of all, you can just use your existing assignments. **Email your assignments to us and we will automate them for you.** We can get you set up in 2 weeks and the first semester is free.

HyperGrade can be used for both online and in-person courses. Further, it can be used for homework and for programming tests.

Teacher benefits:

- Fewer emails asking "is this correct? Is this what you meant?"
- Grading time drops to almost zero
- Improved faculty evaluations from students
- Ability to easily take on another programming course
- Can offer more rigorous assignments to students
- Possibility of eliminating your textbook

Students benefits:

- Students immediately know the requirements of the homework
- Students get instant, 24-hour feedback.
- Assignments can be broken down into smaller steps that slowly increase in difficulty.
- Higher quality homework submissions

HyperGrade is free for the college, free for the instructor, and $19 for students per course. Access codes can be placed in the bookstore so students may use financial aid to purchase. The process is similar to how math instructors require access codes for their online homework.

Can you send me a text message or email? It would be great to meet you over Zoom.
